- SIMILARITY: BELONGS TO THE SMALL LEUCINE-RICH PROTEOGLYCANS
- (SLRPS) FAMILY. CLASS I SUBFAMILY.
  SIMILARITY: CONTAINS 12 LEUCINE-RICH REPEATS (LRR).
  CAUTION: Ref.3 sequence differs from that shown due to a stop codon in position 238.

15-JUN-2002 (Rel. 41, Created) 15-JUN-2002 (Rel. 41, Last sequence update) 15-JUN-2002 (Rel. 41, Last annotation update) 368 AA. Xenopus laevis (African clawed frog). PRT; STANDARD; Biglycan precursor. PGS1\_XENLA Q9IB75; RESULT 3 PGS1\_XENLA

Eukaryota; Metažoa; Chordata; Craniata; Vertebrata; Euteleostomi; Mombibia; Batrachia; Anura; Mesobatrachia; Pipoidea; Pipidae; Xenopodinae; Xenopus. NCBI\_TaxID-8355; SEQUENCE FROM N.A. GOOD T. Kubota H.Y.; "CDNA of biglycan of Kenopus laevis."; Submitted (JAN-2000) to the EMBL/GenBank/DDBJ databases.-!- FUNCTION: May be involved in collagen fiber assembly (By similarity) 

This SWISS-PROT entry is copyright. It is produced through a collaboration between the Swiss Institute of Bioinformatics and the EMBL outstation --:- SUBCELLULĀR LOCATION: Extracellular matrix (By similarity).
-:- SIMILARIY: BELONGS TO THE SMALL LEUCINE-RICH PROTEOGLYCANS
(SLERE) FAMILY. CLASS I SUBFAMILY.
-:- SIMILARITY: CONTAINS 12 LEUCINE-RICH REPEATS (LRR).

                                                                                   -i- TISSUE SPECIFICITY: Found in several connective tissues, specially in articular cartilages.
-i- PTM: The two attached glycosaminoglycan chains can be either chondroitin sulfate or dermatan sulfate (By similarity).
-i- SIMILARITY: BELONGS TO THE SMALL LEUCINE-RICH PROTEOGLYCANS (SLRPS) FAMILY. CLASS I SUBFAMILY.
-i- SIMILARITY: CONTAINS 12 LEUCINE-RICH REPEATS (LRR).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             19; Gaps

Forms a ternary complex with MFAP2 and ELN (By similarity).

SUBCELLULAR LOCATION: Extracellular matrix (By similarity).

ALTERNATIVE PRODUCTS: 2 isoforms; a long form (shown here) and a short form; are produced by alternative splitcing.

PTM: The attached glycosaminoglycan chain can be either chondroitin sulfate or dermatan sulfate depending upon the tissue
                                                                                                                                                                                                                                                                                                                                                               47 GFG----PVCPFRCQCHLRVVQCSDLGLERVPKDLPPDTTLLDLQNNKITEIKEGDFKNL 102

      Submitted (APR-2001) to the EMBL/GenBank/DDBJ databases.

-! SUBUNIT: Binds to laminin (By similarity).

-! SUBCELIULAR LOCATION: Extracellular matrix (By similarity).

-! TISSUE SPECIFICITY: Cornea and other tissues.

-! DEVELOPMENTAL STAGE: Present in the extracellular matrix of human articular cartilage at all ages, although its abundance is far greater in the adult in the adult cartilage lumican exists predominantly in a glycoprotein form lacking keratan sulfate, whereas the juvenile form of the molecule is a proteoglycan.

-! SIMILARITY: BELONGS TO THE SMALL LEUCINE-RICH PROTEOGLYCANS (SLRPS) FAMILY: CLASS II SUBFAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           66 FPFDLF----PMCPFGCQC---YSRVVHCSDLGLTSVPTNIPFDTRMLDLQNNKIKEIKE 118

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Similarity).

SUBGELLUIAR LOCATION: Extracellular matrix (By similarity).

TISSUB SPECIFICITY: Connective tissue.

I DOMAIN: The basic amino-terminal Arg/Pro-rich binds heparin heparan sulfate. Binds collagens type I and type II through leucine-rich repeat domain (By similarity).

SIMILARITY: BELONGS TO THE SMALL LEUCINE-RICH PROTEOGLYCANS (SIRPS) FAMILY.

SIMILARITY: CONTAINS 12 LEUCINE-RICH REPEATS (LRR).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                SMART; SM00013; LRRINT; 1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   MEDIINE-90060020; PubMed-2531085; Oldberg A., Antonsson P., Lindblom K., Heinegaard D.; "A collagen-binding 59-kd protein (fibromodulin) is structurally related to the small interstitial proteoglycans PG-S1 and PG-S2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    fibromodulin isolated from articular cartilage.";

Eur. J. Blochem. 242:402-409(1996).

-- FUNCTION: Affects the rate of fibrils formation. May have a primary role in collagen fibrillogenesis (By similarity).

-- SUBGNIT: Binds to type I and type II collagen.

-- SUBGELLULAR LOCATION: Extracellular matrix.

-- PTM: Binds keratan sulfate chains.

-- SIMILARITY: BELONGS TO THE SMALL LEUCINE-RICH PROTEOGLYCANS

It is also expressed in the developing embryo prior to skeletogenesis. In adult, highest expression in lung, lower levels in cardiac and skeletal muscle.-i-DOMAIN: The basic amino-terminal Arg/Pro-rich binds heparin and heparan sulfate. Binds collagens type I and type II through its leucine-rich repeat domain (By similarity).
